The SAM IO Training Kits include all components needed to simulate intraosseous access with the SAM IO system. Every kit includes a nylon Training Case, Driver, three Needle Sets, Stabilizer, and Adaptor. Simulation Sawbones, including the proximal humerus, proximal tibia, and distal tibia, are also available in the SAM IO Training Kits. All included parts are for training purposes only.

**ENGINEERED FOR SURVIVAL**

**MANUALLY OPERATED DRIVER**

SAM IO is a manually operated intraosseous access system. Catheter placement is achieved by continuously actuating (repeatedly compressing) the driver’s trigger assembly while gently guiding the needle assembly into position. Repeated, full trigger actuation creates rotational spin of the needle assembly which, when combined with gentle downward pressure, results in controlled IO placement. Once needle assembly is properly positioned, the stylet is removed to expose standard Luer-lock for extension set connection. With the extension set connected, aspiration verification, flushing and selected treatment(s) may commence.
